

VPN provides a safe way to connect to the University of Calgary network from any off-campus location.

IT uses Fortinet technology for its VPN services. Fortinet provides FortiClient SSL VPN client software for connecting to the University's Private Network.

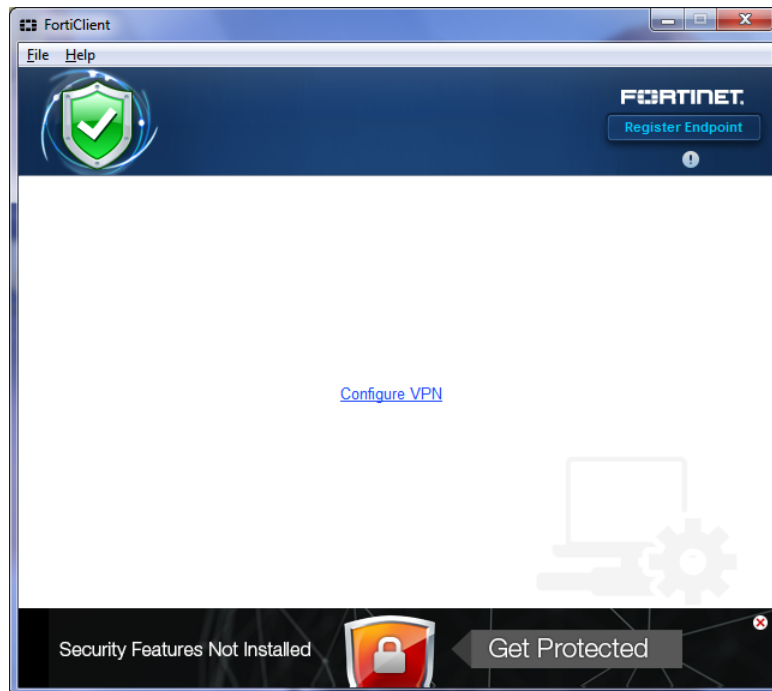

The Admin VPN Service is for faculty and staff at the University of Calgary to securely access networked resources, such as financial and administrative data services, from a remote location. **A SecurID token is required.**

Your manager will inform you of the type of VPN access required to perform your job.

The first time you use the FortiClient software you will be presented with a window to Configure your VPN connection.

Click

Configure VPN

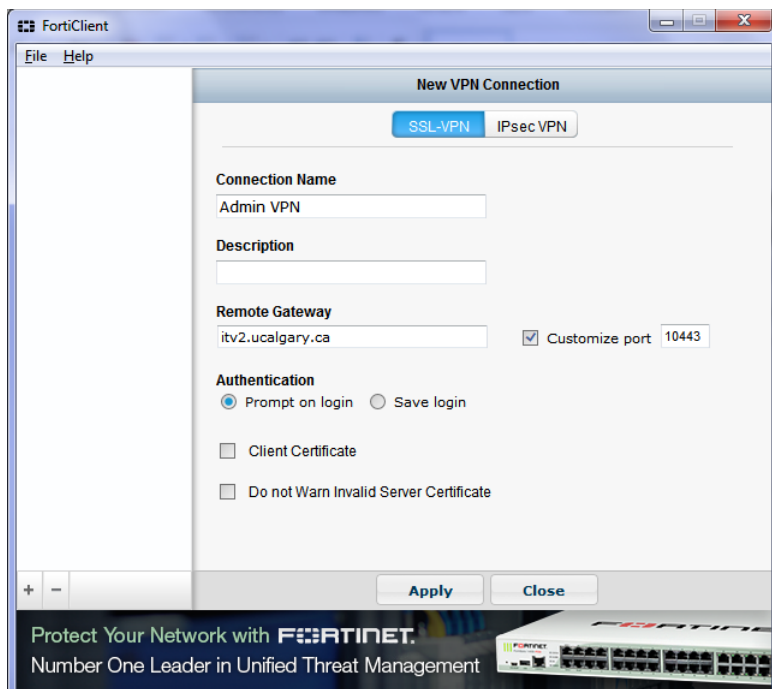

Name your connection.

The address for the General Purpose VPN is **itv2.ucalgary.ca**

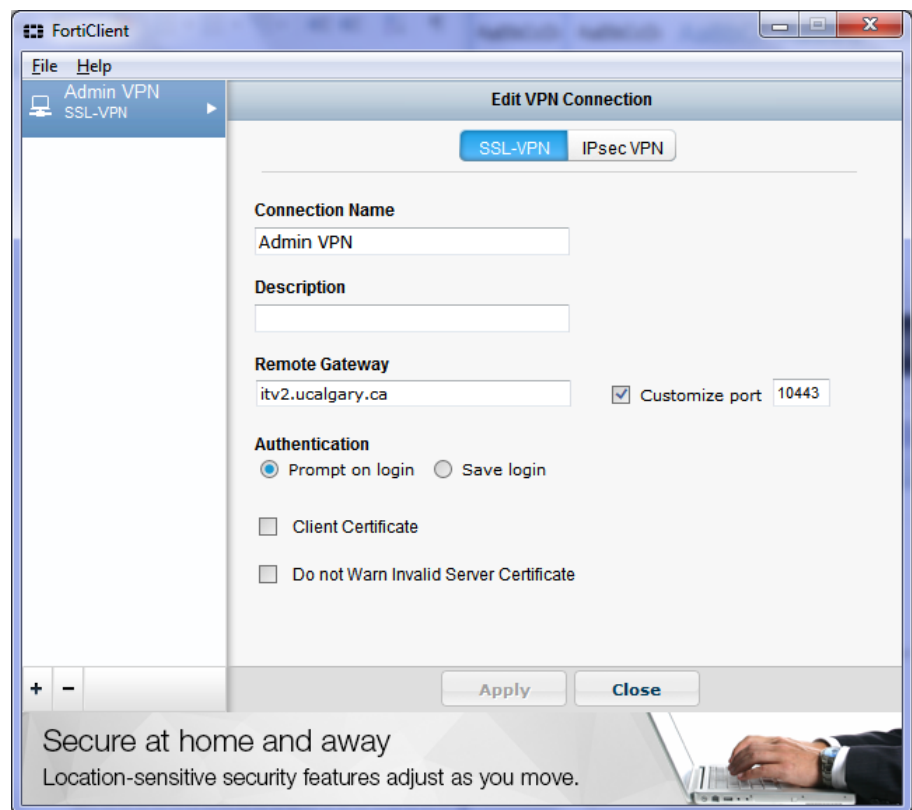

Select the **Customize port**
and set to **10443**

Apply settings.

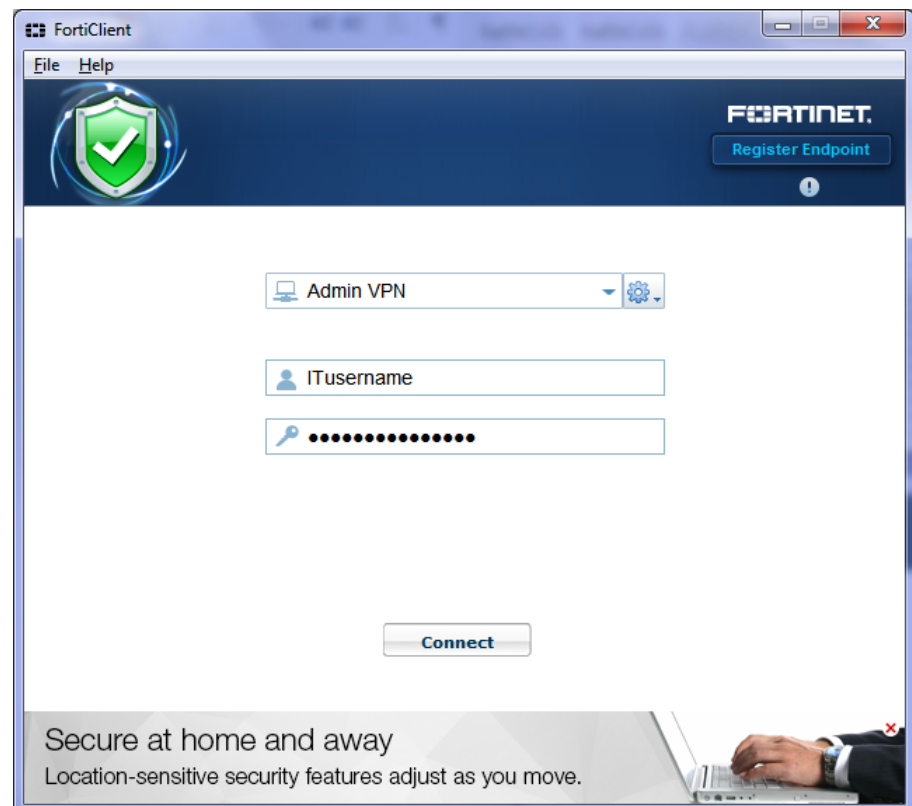

After you Apply the configuration it will be displayed on the left column.

You can **Close** this window.

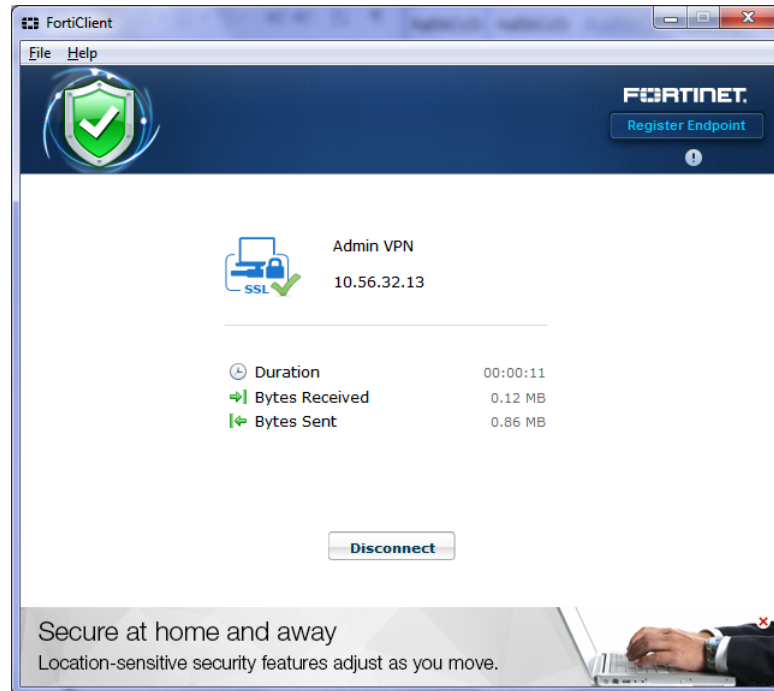

To connect to the VPN you fill in your IT username and password.

Click: **Connect**

When your connection is made, the window will be minimized and put in your toolbar or dock. **Do not close this application.**

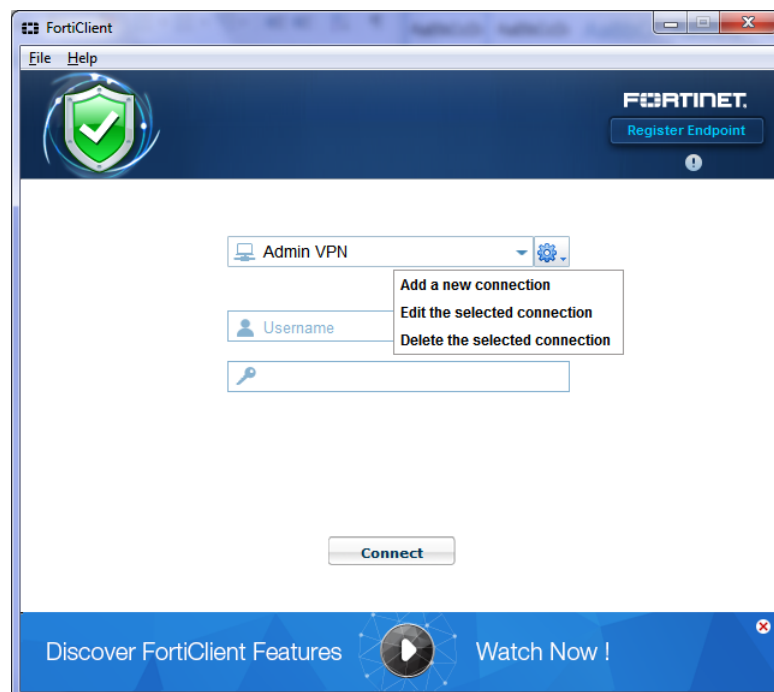

When you are done you can open the application in your toolbar or dock and **Disconnect** the network.

Then use **File**

Exit to close the application.

You can manage your connection configurations using the Dropdown the right side of the connection.
